

DUBAI → GLOBAL

Product Change Specification

PriceOS | AI Revenue Manager for Short-Term Rentals | Global Market Expansion

Field	Detail
Scope	All product documents, agent architecture, studio prompts, onboarding spec, pitch deck, branding
Trigger	Strategic decision to position PriceOS as a global product from Dubai as the first market — not a Dubai-only tool
What does NOT change	Dubai as launch market. Core agent architecture. 9-agent Manager–Worker framework. Pricing model. State machine.
What DOES change	Market intelligence layer. Configuration inputs. Language and copy. PMS priority list. Compliance flags. All product documents.
Notion tasks	Listed in the final section — one row per page, per field that needs updating

1. Strategic Framing

This change is not a rebrand. It is a strategic repositioning that changes how the product talks about itself, configures itself, and serves operators — while keeping Dubai as the first and primary market.

The right mental model:

Dubai is not what PriceOS is. Dubai is where PriceOS was proven first.

Every document, every pitch, every product screen should feel like it was built for a short-term rental operator anywhere in the world — but happens to be exceptionally good at Dubai. That is a stronger story than "Dubai tool now going global."

What stays the same

- The core product: agentic AI that executes revenue decisions, not just recommends them
- The 9-agent Manager–Worker architecture
- The execution loop: observe, propose, approve, execute, verify, monitor, rollback
- The state machine: Connected → Observing → Simulating → Active → Paused
- The pricing model: \$30/property/month with PAYG AI compute above included credits
- Dubai as the first and best-proven market

What changes

- Event Intelligence Agent: Dubai event calendar replaced by a configurable market intelligence layer
- Competitor Scanner: comp set logic now market-agnostic, not Dubai-zone-aware by default
- Pricing Optimizer: Islamic weekend premium logic becomes a configurable parameter, not hardcoded
- Onboarding: zone selection and market setup become user-driven, not Dubai-prefilled
- PMS priority list: Airbnb-native and VRBO-native tools added for US/Europe operators
- All copy and positioning: "Dubai" replaced with "your market" except where specifically referencing the beta
- Compliance flags: short-stay regulations by market become part of onboarding configuration
- Currency: AED default replaced by auto-detect from PMS / operator account

2. Agent Architecture Changes

Six of the nine agents need updates. The Channel Sync Agent, Anomaly Detector, and Reservation Agent are market-agnostic and require no changes. The three revenue intelligence agents and the orchestration layer all need work.

Component	Dubai / UAE (Current)	Global (New)	Impact
Event Intelligence Agent	Dubai event calendar hardcoded: GITEX, UAE National Day, NYE Downtown/Palm/Marina, Dubai World Cup, Art Dubai, Ramadan/Eid, F1 spillover Zone-level demand: Downtown, Marina, DIFC, JBR, Palm, Business Bay	Market-configurable event layer: operator selects their market(s) during onboarding System pulls event calendar for selected markets via API (Ticketmaster, Eventbrite, local tourism boards) Dubai calendar remains as a pre-built template — operators selecting Dubai get it fully loaded New markets: London, Barcelona, Lisbon, NYC, Miami, Nashville, Amsterdam, Paris available as templates Operators can add custom events manually for any market Zone/neighbourhood selection driven by operator during onboarding, not hardcoded	High
Pricing Optimizer	Islamic weekend (Thu/Fri) premium logic hardcoded Summer trough Jul–Aug acceleration hardcoded for Dubai AED as default currency throughout Feeder market patterns: UK, India, Russia hardcoded	Weekend definition becomes configurable: Fri/Sat (global default), Thu/Fri (UAE/GCC), Sat/Sun (some markets) Seasonal trough pattern pulled from market data, not hardcoded calendar Currency auto-detected from PMS account — defaults to operator account currency Feeder market patterns configurable per market during onboarding setup Dubai-specific intelligence preserved as a template — operators on Dubai get it pre-loaded	High
Competitor Scanner	Comp set built from Dubai Airbnb/Booking.com listings by zone Dubai zone compression thresholds (60% unavailability = signal)	Comp set built from any market — operator provides URLs or property names during Stage 1 onboarding Compression threshold becomes configurable (default 60% — can be adjusted per market) Market-specific OTA weighting: Airbnb-heavy in US/AU, Booking.com-heavy in Europe, mixed in UAE	Medium
Data Aggregator	Hostaway, Guesty, Lodgify, Beds24, Hostfully — UAE/Dubai operator priority order	Same PMS list — reordered by market: Hostaway/Guesty (global), add VRBO/Vacasa integrations for US, BookingSync/Rentals United for	Medium

Component	Dubai / UAE (Current)	Global (New)	Impact
		Europe Currency normalisation layer added: all internal calculations in operator's base currency Timezone handling: all scheduling (6AM loop, 8PM summary) relative to operator's local timezone	
CRO (Manager Agent)	Dubai-specific language: "AED", Dubai zones, Islamic calendar awareness baked into prompts References to DTCM licensing in guidance	Market-neutral language by default: "your local currency", "your market", "your primary OTA" Localisation layer: CRO pulls operator's market context from system_state and adapts language accordingly DTCM and UAE-specific references moved to Dubai market template only Regulatory awareness: CRO flags short-stay permit requirements for markets with known restrictions (Paris, Barcelona, Amsterdam, NYC, London)	High
Adjustment Reviewer	Guardrail defaults calibrated to Dubai market volatility ($\pm 15\%$ max single-day change)	Guardrail defaults become market-calibrated: UAE/GCC markets use current defaults, European cities use tighter defaults ($\pm 10\%$), US leisure markets use wider defaults ($\pm 20\%$) Market risk profile loaded during onboarding — operator can override	Low
Channel Sync Agent	No change needed — market agnostic	No change needed — PMS API writes are market agnostic	Low
Anomaly Detector	No change needed — market agnostic	No change needed — monitoring logic is market agnostic	Low
Reservation Agent	Dubai-specific: check-in instructions reference building access norms, no knowledge of non-UAE STR regulations	Language detection: reply in guest's language if comms_policy allows (flag for V2) Remove Dubai-specific access instruction defaults — pull from listing_profile only Regulatory escalation triggers: add "local authority complaint" and "planning permission" as Tier 1 escalation triggers (relevant for Barcelona, Amsterdam, NYC)	Low

3. Onboarding Flow Changes

The 7-stage structure stays identical. Three stages need content changes. The additions are mostly about market setup during the first two stages.

Stage 0 — Account Created: Add Market Selection

New task added between PMS connection and system_state initialisation:
User selects their primary market (country + city/region).
System loads the market template for that location: event calendar, OTA weighting, weekend definition, seasonal pattern, regulatory flags.
If market template exists (Dubai, London, Barcelona, NYC, Miami, Amsterdam, Paris, Lisbon, Nashville, Sydney): pre-loaded.
If market template does not exist: user proceeds with generic global template. System flags: "We don't have a pre-built market template for your city yet — your setup will be manual."
Timezone confirmed from market selection. All scheduling adapts.

Stage 1 — Portfolio Import: Remove Dubai Zone Hardcoding

- Auto-grouping by zone no longer uses Dubai zone names as defaults
- Zone/neighbourhood names pulled from PMS listing data or entered by user
- Comp set assignment now explicitly prompts for OTA type by market: "Which OTA do your guests primarily book through? Airbnb / Booking.com / VRBO / Other"
- Protected date logic unchanged — market agnostic

Stage 2 — Guardrails: Add Market-Calibrated Defaults

Parameter	UAE/GCC Default	Europe Default	US Leisure Default	US Urban Default
Max single-day change	±15%	±10%	±20%	±12%
Max weekly drift	±40%	±25%	±50%	±30%
Auto-approve threshold	5%	3%	7%	4%
Gap fill discount max	20%	15%	25%	15%
Weekend definition	Thu/Fri	Fri/Sat	Fri/Sat	Fri/Sat
Summer trough months	Jul–Aug	Jul–Aug	Jan–Feb (some)	No standard pattern

Stage 2 — Guardrails: Add Regulatory Awareness Step

New step added at the end of Stage 2 for markets with known short-stay regulations:

Market	Regulatory flag surfaced during onboarding
Barcelona	Short-stay licences required. Licence number field added to unit setup. CRO flags unlicensed units.
Amsterdam	Short-stay permit required. Max 30 nights/year in some zones. CRO surfaces night-count tracking.
Paris	Primary residence rule — max 120 nights/year for non-primary. CRO tracks and warns at 100 nights.
New York City	Local Law 18 — most short-term rentals banned. CRO flags NYC units with a hard warning.
London	90-night annual cap. CRO tracks and warns at 80 nights.
Dubai / UAE	DTCM licence required. Holiday Home permit required. Flag unlicensed units.
All others	Generic disclaimer: "Check local short-stay regulations. PriceOS does not provide legal advice."

Stages 3–6 — No Structural Changes

The observation, simulation, activation, and steady-state stages are market-agnostic by design. The CRO's language adapts based on the market context loaded in Stage 0. No structural changes required.

4. Copy, Positioning and Brand Changes

Tagline

	Current	Global version
Tagline	Autonomous Pricing for Short-Term Rentals in Dubai	Autonomous Pricing for Short-Term Rentals
Hero subline	Built for Dubai's holiday home operators	Built for short-term rental operators who want results, not dashboards
Market reference	"Dubai's fastest-growing STR market"	"Your market, your data, your execution"

Product Description — One Paragraph

REMOVE:
"AI Revenue Manager built for Dubai's short-term rental market. Understands GITEK demand, Ramadan seasonality, Islamic weekend premiums, and DTCM licensing requirements."

REPLACE WITH:
"PriceOS is an agentic AI revenue manager for short-term rental operators. It watches your market, proposes pricing decisions, executes the approved ones directly into your PMS, verifies every change, and rolls back anything that goes wrong — automatically. Proven first in Dubai. Built for everywhere."

Dubai — How to Reference It Going Forward

Dubai is proof, not scope. Every external document and pitch should reference Dubai as the validation market — not the target market.

"Live beta in Dubai with 200+ units. 20% revenue lift. Expanding to Europe and US."

Never say "Dubai-focused" or "built for Dubai" in the tagline, hero section, or pitch headline again.

The Dubai market intelligence is a competitive advantage — the best event calendar, zone data, and seasonal patterns of any STR market. That is a selling point: "We are so good at Dubai, we made it a template. Your city is next."

5. PMS and Integration Priority Changes

Region	V1 Priority (Dubai)	V2 Priority (Global)
Global	Hostaway (primary) Guesty (primary)	Hostaway — global leader, keep primary Guesty — global, keep primary
Europe	Lodgify (third) Beds24 (fourth)	Lodgify — strong Europe presence Smooibu — European-first, growing BookingSync — European operators Beds24 — legacy European install base
US / AU	Hostfully (fifth)	Hostfully — growing US presence Ownerrez — strong US vacation rental market Track (formerly Glad to Have You) — US focus VRBO-native tools — Escapia, Barefoot
GCC / UAE	All five original	All five original — plus Staah for Gulf hotel/STR hybrid operators

New Integration Requirements

- Timezone handling in all API calls — scheduling must use operator local time, not Dubai time
- Multi-currency support in Data Aggregator: normalise all revenue data to operator base currency
- OTA weighting configuration: Airbnb-dominant (US/AU/UK), Booking.com-dominant (Continental Europe), mixed (UAE)
- VRBO/Expedia integration added to V2 roadmap — required for US market entry

6. Notion Update Tasks

Everything that needs to change in Notion, listed by document, page, and specific field. Work through this list top to bottom.

How to use this list: open each Notion document listed below. Find the page and field. Make the change described in the Action column. Tick off when done.

Priority: items marked High Impact in the agent changes section should be updated first — those affect product behaviour. Copy and positioning changes can follow.

Document	Page / Section	Field / Content	Action
PRD v2	Strategic Context	Market definition	Replace "Dubai STR market" with "global STR market — Dubai first market". Add one paragraph on global market sizing.
PRD v2	Strategic Context	Competitive landscape	Remove Dubai-specific framing. Keep PriceLabs/Beyond Pricing/Wheelhouse as global competitors — they are.
PRD v2	Event Intelligence Agent	Agent definition	Replace hardcoded Dubai event calendar with "market-configurable event layer" description. Add market template concept.
PRD v2	Event Intelligence Agent	Dubai zone list	Move Dubai zone list to an appendix titled "Dubai Market Template" — preserve but do not present as the default.
PRD v2	Pricing Optimizer	Islamic weekend logic	Change from hardcoded to "weekend definition = configurable parameter, default Fri/Sat globally, Thu/Fri for UAE/GCC template".
PRD v2	Pricing Optimizer	Summer trough	Change from "Jul–Aug Dubai trough" to "seasonal trough: market-dependent, loaded from market template".
PRD v2	Pricing Optimizer	Currency references	Replace all AED references with "operator base currency". Move AED to Dubai Market Template appendix.

Document	Page / Section	Field / Content	Action
PRD v2	Pricing Optimizer	Feeder market patterns	Change UK/India/Russia hardcoded list to "feeder market patterns: configured per market template or manually by operator".
PRD v2	Data Aggregator	PMS priority list	Update to global priority list as per Section 5 of this document.
PRD v2	CRO (Manager Agent)	System prompt language	Remove Dubai-specific references. Add "market context loaded from system_state" instruction.
PRD v2	CRO (Manager Agent)	Regulatory awareness	Add regulatory flag behaviour for Paris, Barcelona, Amsterdam, NYC, London, Dubai as described in Section 3.
PRD v2	Adjustment Reviewer	Default thresholds	Change from fixed Dubai defaults to market-calibrated defaults table as per Section 3 of this document.
PRD v2	Configuration	Market setup section	Add new section: Market Setup. Covers market selection, template loading, timezone, currency, weekend definition.
PRD v2	PMS Integration	Integration list	Update to global PMS list. Add VRBO/Escapia/Ownerrez to V2 roadmap.
Onboarding Spec V2	Stage 0	Task list	Add Task: Market Selection. Describe market template loading as per Section 3 of this document.
Onboarding Spec V2	Stage 1	Auto-grouping	Remove Dubai zone names from auto-group defaults. Change to "pulled from PMS listing data or entered by user".
Onboarding Spec V2	Stage 1	Comp set setup	Add OTA-type question: "Which OTA do your guests primarily book through?"
Onboarding Spec V2	Stage 2	Guardrail defaults table	Replace single-column defaults with market-calibrated defaults table (UAE/GCC, Europe, US Leisure, US Urban).

Document	Page / Section	Field / Content	Action
Onboarding Spec V2	Stage 2	New step: Regulatory	Add regulatory awareness step at end of Stage 2. Use table from Section 3 of this document.
Onboarding Spec V2	All stages	CRO scripts	Review all CRO scripts for Dubai-specific language. Replace with market-neutral equivalents.
Reservation Agent Prompt	Hard Limits	Regulatory escalation	Add "local authority complaint" and "planning permission" as Tier 1 escalation triggers.
Reservation Agent Prompt	Step 3 — Knowledge Lookup	Regulatory context	Add: CRO checks market regulatory flags from system_state before composing any reply involving guest rights or complaints.
Pitch Deck Content	Slide 1 — Cover	One-liner	Update to: "We don't recommend pricing decisions. We execute them." — already market neutral. No change needed.
Pitch Deck Content	Slide 2 — Problem	Setup paragraph	Replace "Dubai's short-term rental market is booming" opening with global STR market framing. Reference Dubai as an example.
Pitch Deck Content	Slide 3 — Market	Market table	Already has global market table. Remove any Dubai-only framing in the intro paragraph.
Pitch Deck Content	Slide 4 — Solution	Dubai references	Remove "Dubai-first event intelligence baked in from day one" from the callout. Replace with "Market-native intelligence for every city we launch in."
Pitch Deck Content	Slide 6 — Product	Event Intelligence row	Update to: "Monitors your local event calendar — GITEX, NYE, Glastonbury, SXSW — zones demand signals with confidence scores."
Pitch Deck Content	Slide 7 — Traction	Beta framing	Keep Dubai beta numbers. Strengthen framing: "Proven in Dubai — the world's most complex STR market. Expanding to London,

Document	Page / Section	Field / Content	Action
			Barcelona, Miami."
Pitch Deck Content	Slide 9 — GTM	Phase 1 description	Add one line: "Dubai proves the model. Europe and US prove the scale."
Pitch Deck Content	Slide 13 — Vision	Closing callout	Already market-neutral. No change needed.
Brand / Website	Tagline	Tagline text	Remove "in Dubai" or "for Dubai" from tagline. Use: "Autonomous Pricing for Short-Term Rentals."
Brand / Website	About / Home	Hero subline	Replace Dubai-specific subline with: "Built for short-term rental operators who want results, not dashboards."
Brand / Website	About / Home	Market reference	Change "Dubai's fastest growing STR market" to "Proven in Dubai. Built for the world."
Brand / Website	LinkedIn cover	Cover image	Current cover is already market neutral — no change needed.

7. What Does Not Change

As important as knowing what to update is knowing what to leave alone. Do not over-engineer this.

Component	Why it stays the same
9-agent Manager–Worker architecture	Market agnostic by design. The agent roles, responsibilities, and interaction model work in any STR market.
State machine (Connected → Active)	Execution trust-building is universal. Every operator in every market needs the same onboarding journey.
Execution loop	Propose → approve → execute → verify → rollback is market agnostic. The logic does not care what city the property is in.
Rollback architecture	Rollback payload, 72-hour retention, verification steps — all market agnostic.
Pricing model (\$30/unit/month)	Price point works globally. Comparable to PriceLabs in every market. No change.
User types (PM, in-house RM, agency)	These three user types exist in every STR market worldwide.
Approval workflow	Low/medium/high risk tiers, one-tap approval — market agnostic.
Channel Sync Agent	PMS API writes are market agnostic.
Anomaly Detector	Post-execution monitoring logic is market agnostic.
Dubai market intelligence	Preserved as the Dubai Market Template — the best pre-built template in the system. Becomes a competitive advantage, not a limitation.
